

Open with evidence

SAY

Career advice is everywhere, but most of it starts with assumptions. Path Forger starts with evidence. It turns resumes, transcripts, project notes, or guided answers into a career plan people can inspect and act on.

CUES

- Pause after: starts with evidence.
- Do not explain architecture yet.

Tell them what to watch

SAY

The problem is trust. During the demo, watch for three things: an editable profile, role-specific gaps and projects, and the evidence or warning behind the plan.

CUES

- Keep this to 20 seconds.
- Transition: Let me show you the loop.

Demo: context to run

SAY

Show Overview and Student briefly. Apply the synthetic student context, review the Background page, extract the editable Profile, then choose Technology, Data Analyst, a specialization, and a realistic timeline. Run the agent.

CUES

- Narrate decisions, not clicks.
- Profile visible by 2:15.
- Agent running by 3:15.

Demo: inspect the proof

SAY

On Results, show one recommended path, the top ranked gap, one portfolio project, supporting evidence or warning, and the provider trace. Open Review briefly, then return to slide 4.

CUES

- Do not read every result.
- Trace visible by 5:15.
- Return to deck at 5:45.

Close and take questions

SAY

Path Forger shows the profile, evidence, gaps, projects, actions, warnings, and trace behind a plan. A good career plan should show its evidence, not just its advice. I am happy to answer questions.

CUES

- Slow down on the thesis.
- Use backup slides only if asked.

Technical answer bank

SAY

Architecture: typed extraction, deterministic tools, then reasoner and verifier. Provider-neutral protocols support Gemini, OpenAI, Qwen, local HTTP, and offline demo. AI workflow: Claude Code for architecture/review; Codex for implementation/tests/docs; human approval for what shipped.

CUES

- Answer the question first.
- Then open only the relevant backup slide.
