

Open with evidence

SAY

Career advice is everywhere, but most of it starts with assumptions. Career GPS AI starts with evidence. It turns resumes, transcripts, project notes, or guided answers into a career plan users can inspect and act on.

CUES

- Pause after: starts with evidence.
- Do not explain architecture yet.

Define the difference

SAY

The problem is not a lack of AI advice. The problem is trust. Users need to see what the system learned, what is missing for a target role, and what they can build next to prove readiness.

CUES

- Point: problem -> product.
- Transition: Let me show you the loop.

Run the 90-second demo

SAY

Use a synthetic background. Extract the editable profile, choose a direction, run the agent, then show exactly one recommended path, one top gap, one project, and one trace or warning.

CUES

- Do not narrate loading.
- Stop the demo at 2:40.
- Bridge: Why is this dependable?

Explain reliability

SAY

First, typed extraction creates a reviewable profile. Second, five deterministic tools calculate evidence, gaps, projects, and actions. Third, the reasoner and verifier preserve warnings, caveats, latency, fallback events, and routing trace.

CUES

- Use the three columns as rhythm.
- Provider-neutral: Gemini, OpenAI, Qwen, local, offline.

Prove AI and technical depth

SAY

Claude Code supported architecture and review. OpenAI Codex supported implementation, debugging, tests, and documentation. Runtime models return the same schema-bound structures behind provider protocols. Human decisions controlled what shipped.

CUES

- Name both agents clearly.
- Verify this matches your real workflow.

Close on the thesis

SAY

Career GPS AI shows the profile, evidence, gaps, projects, actions, and warnings behind a plan. A good career plan should show its evidence, not just its advice. That is the difference between a chatbot response and a plan someone can critique, improve, and follow.

CUES

- Slow down on the thesis.
- Stop. Look up. Invite questions.
